

Instructions on how to use the Kumba ride share windows (exe) app

1. Go to https://drive.google.com/file/d/1VAVnPF_NtOGnyn-Uck08LEnAtq0BF2mV/view?usp=drive_link download the KumbaInstaller zip folder and then extract all . After doing a new unzip folder with the same name will show up.
2. Open the KumbaInstaller folder and then first run the **setup_env** file and then run the **KumbaInstaller** application.
3. After running the application, the file should be on your homepage. It should look like

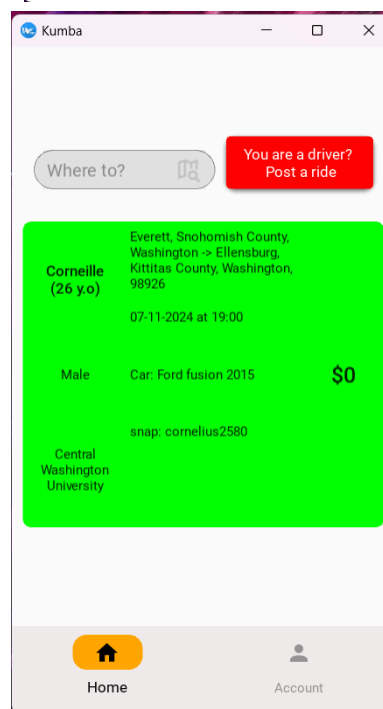

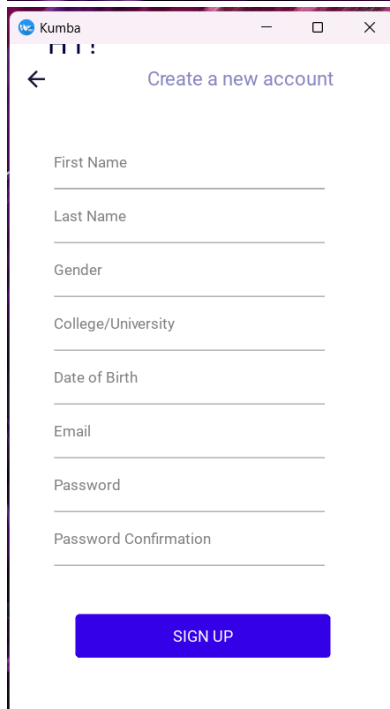

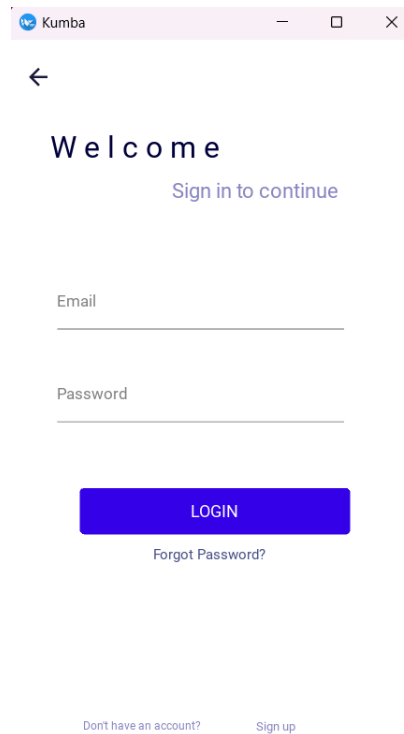

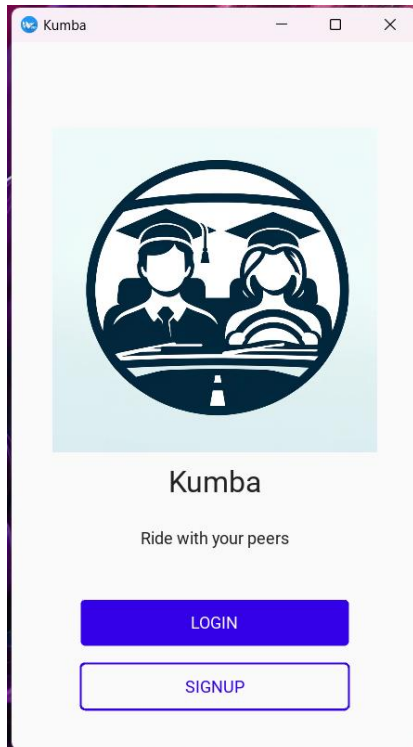

this

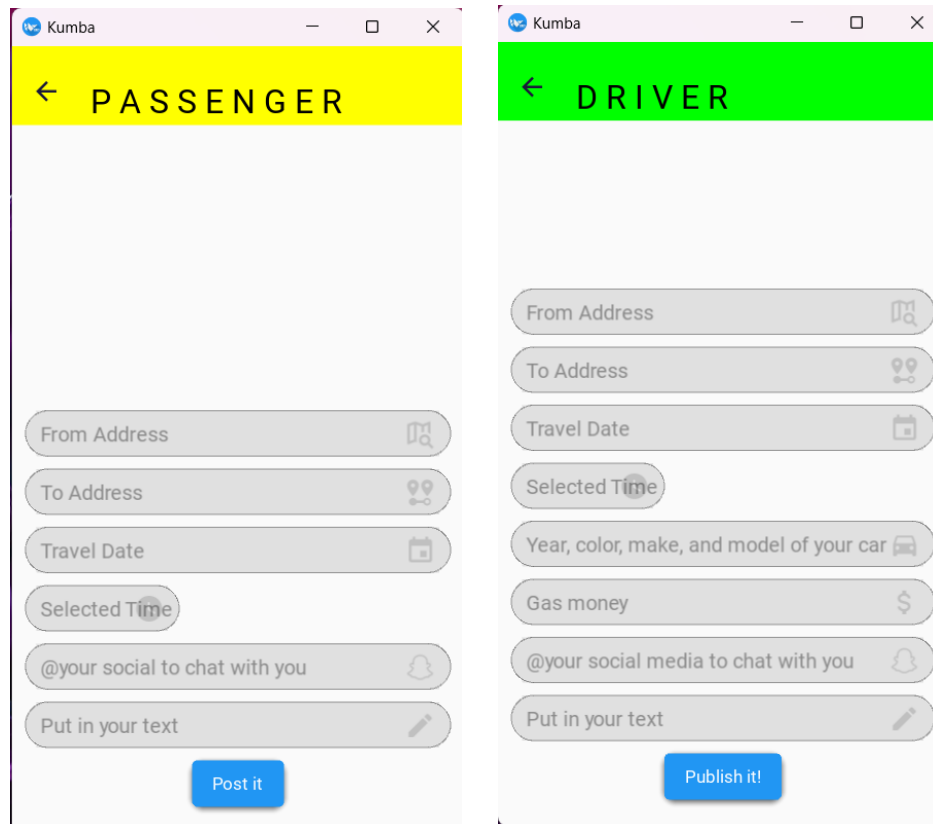

or this

4. The app should look like this when running it:

Kumba students Ride share app by Corneille Ngoy

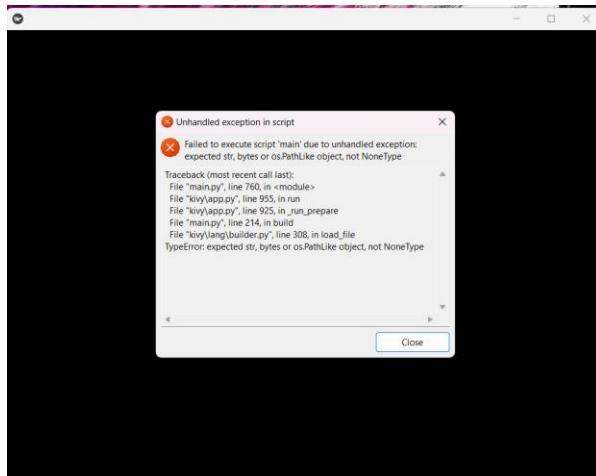

To register you will need to be at least 18 years old and have access to a US student email that ends with .edu that's because in the registration process an authentication number will be sent to you via email.

Yellow is for a passenger looking for a ride and **Green** is for a driver offering rides. I wasn't able to add a chat feature, so I added the possibility to add your social media to communicate with the person you want to ride with. I would recommend snapchat. It's faster, but it's up to you.

Possible problems that might occur when launching the KumbaInstaller application.

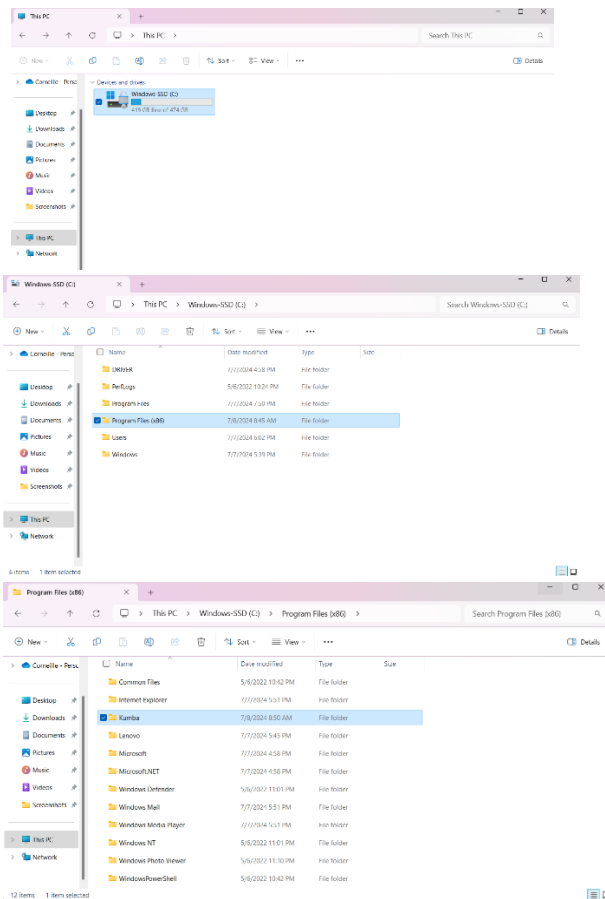

1. You may get this error message when running the app from your desktop:

Kumba students Ride share app by Corneille Ngoy

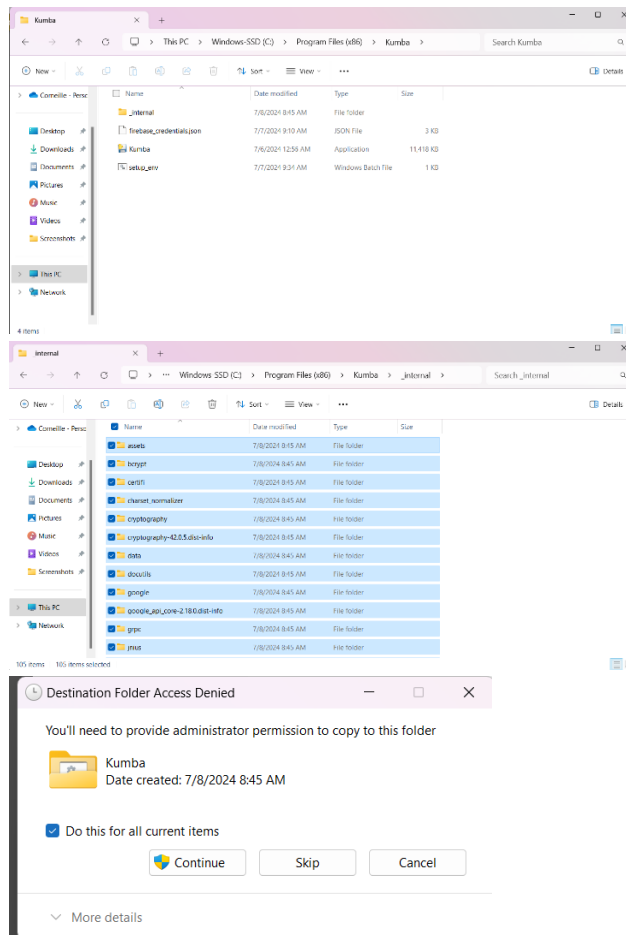

What you should do is go to **“This PC”** ⇒ **“Windows SSD (C:)”** ⇒ **“Program Files (x86)”** ⇒ **“Kumba”** ⇒ **“Internal”**. Copy everything that’s in internal by pressing **“Ctrl – A”** and then paste in the **“Kumba”** Folder.

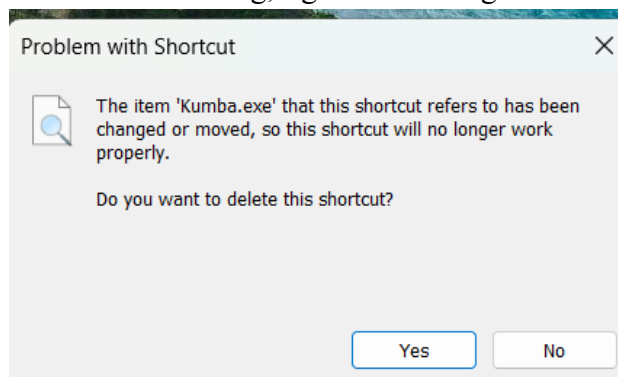

Then, go back to the desktop, run it again, and it should work. Here are the steps with pictures.

Kumba students Ride share app by Corneille Ngoy

2. Another problem that might occur is that I have noticed that when the McAfee Antivirus is running, I get this message.

Basically, the antivirus blocks the application because it's unknown program which is completely normal.

To fix this problem, click on "yes" to delete the shortcut, "turn off" the Antivirus "real time scanning" and then run the KumbaInstaller again.
